Abstract

Tobacco is often accused of using more pesticides than other crops. The examination of surveys published by the US Department of Agriculture show that pesticide use on tobacco is much lower than on other major crops such as apples, citrus, strawberries, potatoes, carrots or onions.

The evaluation of the use rates on the labels of pesticides publicly available in a number of countries (chosen for the facility of reading the language) shows that the rate of use of tobacco are in line if not lower than those of many other crops.

Tobacco companies work with tobacco boards, universities and agrochemical producers to train farmers on the safe use of pesticides and to develop information on integrated pest management in order to minimize the amount of pesticides needed.

Background

One of the main charges against tobacco-growing needs high inputs of pesticides.

The Framework Convention on Tobacco Control (FCTC) has set up a Working Group on economically sustainable alternatives to tobacco-growing. The Working Group summarized in such a way the impact of tobacco growing:

"Various occupational risks related to tobacco growing were reviewed, including pesticide intoxication, The group acknowledged that tobacco growing causes biodiversity losses, land pollution due to pesticides,"¹

Evidence from official documents

There are not many official comparative studies reporting the amount of plant protection products used on different crops which allow understand whether tobacco uses more agrochemicals than other crops. However some information can be taken from the database of the US Department of Agriculture, which conducted a survey on the use of plant protection products in 1992, 1997 and 2002². It appears clearly that tobacco uses less agrochemicals than other major crops such as strawberries, citrus fruits, apples, potatoes or carrots.

Total pesticide use	1992			1997			2002		
	acres crop	lb	lb/acre	acres crop	lb	lb/acre	acres crop	lb	lb/acre
Apples	497,903	25,153,654	50.519	632,642	24,345,397	38.482	458,227	19,490,672	42.535
Carrots	109,640	6,086,431	55.513	133,337	11,049,047	82.866	111,680	700,897	6.276
Citrus	878,300	36,111,808	41.116	1,343,919	85,851,908	63.882	1,277,214	76,968,901	60.263
Cotton	11,120,700	119,318,325	10.729	13,227,053	75,998,748	5.746	12,400,209	49,252,338	3.972
Maize	91,336,196	239,613,818	2.623	75,522,035	225,439,649	2.985	75,042,567	168,149,418	2.241
Onions	167,076	2,776,046	16.615	163,950	7,214,925	44.007	162,393	6,199,309	38.175
Potatoes	1,326,000	59,607,034	44.953	1,353,108	110,681,406	81.798	1,263,995	105,809,224	83.710
Strawberries	57,778	9,073,965	157.049	52,310	11,819,073	225.943	56,897	10,465,190	183.932
Tobacco	1,054,970	24,400,552	23.129	838,159	26,974,241	32.183	454,913	14,336,648	31.515

² US National Pesticide Use Database 1992, 1997, 2002,
http://www.croplifefoundation.org/cpri_npud2002.htm

A similar comparison was carried out in 2007 by the Sugarcane Industry Association of Brazil, which described the amount of pesticides used in terms of active substance per hectare on tobacco as one of the lowest among major crops, certainly much lower than the amounts used on apples, tomatoes, potatoes, oranges, cotton, grapes, garlic, onion, bananas, soybean, peanuts, coffee, sugarcane, wheat, millet, rice.³

Additionally, the amount of pesticides used on tobacco can be easily compared with those used on other crops simply by reading the instructions on the labels of plant protection products. Because plant protection products are generally considered as hazardous chemicals, they are among the most rigorously regulated chemicals in the world. Both the active substance and the formulation(s) are registered by governmental authorities in order to be sold and used in a country. In general the registration of pesticides is the process through which the appointed national authority examines the active substance of a pesticide, the site or crop on which it is to be used, the amount, frequency and timing of its use, and storage and disposal practices. The authority normally evaluates the pesticide to ensure that it will not have unreasonable adverse effects on humans, the environment and non-target species. The decision of the national authorities is based on a long list of studies which are required by law and are submitted by the pesticide manufacturers in order to obtain the registration (i.e. the permission to sell and use the pesticide in the country on given crops). The levels of use for each crop that the national authority approves in each country are listed on the label of the formulated plant protection product that is sold on the market. Therefore one can compare the potential level of allowed use of a plant protection product registered for use on tobacco in comparison with other crops. In many countries, the labels of plant protection products are published in official journals as part of the governmental decree regulating their use⁴.

It is therefore be practical and informative to make a survey of the labels of plant protection products registered for use on tobacco.

Annex 1 shows a sample collection of over 170 labels⁵ of pesticides which can be found on the websites of either the governmental registration authorities or the websites of the agrochemical manufacturers, which are generally accepted as official documents. The selection criteria of the countries included in this collection is that they have science-based registration authorities, and the language of the label can be readily understood. Other labels can be obtained, and registration numbers and the product names allow for additional search on the internet. From the extensive list of the labels provided in Annex 1, one can see that the use rates of the different pesticides registered for use on tobacco are in line, if not lower, than those of other crops.

Best practice

Many countries dispose of governmental bodies, generally called tobacco control boards, which have important duties in training tobacco growers in good agricultural and environmental practices, promote scientific and technologic progress, and also monitor the activities of tobacco growers and tobacco companies. Examples of these activities can be seen in the largest tobacco producing countries such as China⁶, India⁷, the Philippines⁸, Zimbabwe⁹.

Like their counterparts in several other agricultural sectors, tobacco farmers and tobacco companies fully understand the benefits of a sustainable approach to managing the pests that affect tobacco by combining biological, cultural, physical and chemical tools in a way that minimizes economic, health and environmental risks. Working under the leadership of the University of Kentucky, several scientists from universities, research centers and tobacco companies have joined forces in an Integrated Pest Management (IPM) task force.¹⁰ The objectives of the task force are

- a) to summarize available IPM strategies relevant for each tobacco pest and disease, and
- b) to produce a document for agronomists & farmers,
 - structured by disease / pest
 - providing a common outline framework based on relevant IPM.

The result of IPM is a reduction of use of plant protection products of chemical origin. The information documents, which will cover all diseases which affect tobacco, are progressively available on internet.¹¹

Several state universities or research centers have specific programmes on plant protection use in tobacco. For instance, just to mention the main tobacco producing countries, the Virginia Polytechnic Institute and State University's extension program for tobacco IPM educates growers and extension agents about current pest management practices including the use of economic thresholds, field scouting, cultural practices, and insecticides for managing the major insect pests of tobacco for optimum profits and minimum impact on the environment.¹² In India, the National Institute of Plant Health Management organizes specific courses on plant protection use for tobacco farmers in cooperation with the Indian Tobacco Board.¹³

As acknowledged by the EU¹⁴, in Europe Good Plant Protection Practices (GPPP) for tobacco existed already in 2002, thanks to the work of the European and Mediterranean Plant Protection Organization (EPPO).¹⁵

Tobacco companies and tobacco organization also actively cooperate with plant protection product manufacturers in order to train farmers in technologies aiming at reducing the use of chemicals in the fields. An example of this in Brazil and Guatemala is taken as a representative case study in a publication by the United Nations Industrial Development Organization (UNIDO) and World Business Council for Sustainable Development (WBCSD)¹⁶.
